DETAILED ACTION

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-10, 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over EP 0 619 268 in view Wold 6,290,927 and 5,026,535, optionally further in view Manning et al (5,000,858).

EP '268 discloses a process for the production of hydrogen chloride from chlorous waste material (I), comprising the following steps:

- a. combustion of (I);
- b. scrubbing the flue gas to produce crude acid (II);
- c. treating the waste liquid partly accruing in the scrubber to produce residual waste with a high solid content and a solution (III) containing chloride;
- d. recycling (III) to step a.
- e. distilling (II) with an entrainer (IV) to produce HCI-rich gas (V) and remove impurities which are soluble in (IV);
- f. optionally separating HF from (V);
- g. drying (V) by adsorption and regenerating the adsorbent (VI), giving an aqueous concentrate which is passed to waste liquor treatment; and

Application/Control Number: 09/842,136

Art Unit: 1754

h. working (IV) by evaporation of water and precipitation and filtration of impurities, the aqueous condensate being recycled to gas scrubber, while the filtered solids are passed to waste liquor treatment for recovery of chloride (note English abstract).

EP '268 further discloses that hydrazine can be added to the crude acid to remove the elemental chlorine before the distilling step (note column 6, lines 39-47). EP '268 also teaches that ammonium bisulfite or ammonium sulfite can be used (note column 3, lines 14-21).

The order of adding the reducing agent to the acid gas or solution is not seen as a patentable difference, as long as the reducing agent is capable of removing the elemental chlorine from the crude acid solution.

For claim 10, the step of liquefying the hydrogen chloride gas is known and conventional in the art, especially when such hydrogen chloride gas needs to be transported or stored because it would reduce the volume of the gas.

The difference is EP '268 does not disclose that oxidation-reduction potential of the crude acid, after adding the hydrazine and the automatic controlling.

Wold '927 discloses a process for removing iron and halogen coloring materials from hydrochloric acid, wherein a reducing agent is used to remove the halogens (chlorine and bromine) (note claim 1). Wold '927 teaches the level of halogens in the final hydrochloric acid is desired to be lower than 1 ppm (note Example 2, column 3, lines 48-50).

It would have been obvious to one of ordinary skill in the art at the time of the invention was made to optimize the amount of reducing agent added to the process of

Application/Control Number: 09/842,136

Art Unit: 1754

WP '268 in order to reduce the halogen content, including chlorine, to a level lower than 1 ppm as taught by Wold '927. By doing so, the oxidation-reduction potential of the solution in the combined teaching would inherently be lower than 900 mV as required in the instant claim.

(As disclosed in the instant specification, the oxidation-reduction potential is adjusted by adding hydrazine or analogous compound in order to facilitate the removal of elemental chlorine from the crude hydrogen chloride aqueous solution. In EP '268, hydrazine is also added for the same purpose).

For the automatic controlling step, Jonsson '535 discloses a process for decoloring sulfuric acid by adding hydrogen peroxide (note claim 1). Jonsson '535 further discloses that the hydrogen peroxide addition is advantageously controlled automatically with respect to the acid produced. Thus, it is possible to monitor the coloring effect continuously, and therewith determine the amount of peroxide that needs to be added (note column 2, lines 63-68).

Even though Jonsson' 535 discloses a process for decoloring sulfuric acid, not hydrochloric acid as in the process of EP '268, however, both processes are dealing decoloring an acid by adding a chemical compound, thus, they are considered as analogous art in this respect.

It would have been obvious to one of ordinary skill in the art at the time of the invention was made continuously and automatically control the amount of the reducing agent used in the process of EP '268 as suggested by Jonsson '535 because by doing so the amount of reducing agent can be controlled.

Art Unit: 1754

Optionally, Manning '858 can be applied to teach that the amount of reducing agent to be added to a process can be controlled by measuring and monitoring the oxidation-reduction potential (note column 6, lines 61-67).

Applicant's arguments with respect to claims 1-10, 12 have been considered but are most in view of the new ground(s) of rejection.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ngoc-Yen M. Nguyen whose telephone number is (571) 272-1356. The examiner is currently on Part time schedule.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stanley Silverman can be reached on (571) 272-1358. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 872-9306 for regular communications and (703) 872-9306 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0661.
